

Turning waste into Europe's future semiconduct or materials

- Strengthening European supply security
- Demonstrating eight technologies at TRL 6–7
- Enabling circular semiconductor value chain

Waste streams:

- Photovoltaic waste
- Asbestos mining waste
- Geothermal water residues

Europe's semiconductor industry relies heavily on critical raw materials that face increasing supply risks.

WISER develops circular and traceable value chains to recover antimony, silicon and silver from secondary resources and convert them into semiconductor-grade materials.
